GAJ Technology is now shipping its new 24 Port - 1u Rack Mount Unit: "12 wire lines in One Rack Mount Case"

GAJ Technology announced its new innovation in wire line simulation especially geared towards the telecommunication industries lab needs.

If you are a company that presently tests using up to 100 metres of cable which takes up valuable space in your lab, consider using GAJ technology's new simulator. Conveniently, each of the 12 wire lines can be a different simulated length and a different category, making this the ideal lab bench test tool to verify any item under test without using real cable. You will get accurate, reliable and repeatable test results without using huge spools of bulky cable.

"We have packaged our wire line simulation modules into a single 12 wireline unit that can be used in a rack mount or on the test lab table.

Each of the 12 wire lines simulate 4 pair of CAT5/5e or CAT6 cable in lengths of 10m, 20m, 40m, 80m and 100metre cable and each port may contain either category of cable or any of the available simulated length. These ports can also be "Daisy Chained" to provide up to 1200 metres of simulated CAT5/5e or CAT6 cable. Ideal for engineering test and production line needs.

These 12 wire lines can be configured to contain any of our simulated lengths in Cat5/5e or CAT6, both standard and **PoE** version.
